GENERAL INFORMATION

Site Description and Operational History: Provide a brief description of the site and its operational history. State the site name, owner, operator, type of facility and operations, size of property, active or inactive status, and years of waste generation. Summarize waste treatment, storage, or disposal activities that have or may have occurred at the site; note whether these activities are documented or alleged. Identify all source types and prior spills, floods, or fires. Summarize highlights of the PA and other investigations. Cite references.

The Bristol Company (Bristol) is located at 40 Bristol Street in Waterbury, New Haven County, Connecticut (latitude 41° 31' 30" North, longitude 73° 03' 10" West). Bristol operated on the property from approximately 1897 until 1961. Bristol produced a line of instrumentation including temperature controls, chemical sensors, recorders and indicating devices for industrial use. Babcock Wilcox, Ltd., the Bristol Babcock Company and the American Chain and Cable Company manufactured similar products on-site between 1961 and September 1988. The property has been vacant since September 1988 [2,3].

The approximately 17 acre Bristol property is located in a residential and commercial zoned area of Waterbury [4]. According to the City of Waterbury Tax Assessor's records, the property is located on Map 545, Block 1177 and Lot 6 [5]. The property is immediately bordered to the west and north by narrow wooded areas approximately 100 feet wide, to the east by the Boston and Maine Railroad and the Naugatuck River and to the south by a wooded area. Land uses in the site vicinity include single family residential to the west, single and multi-family residential to the north, residential, commercial and industrial to the east across the Naugatuck River and residential and vacant land to the south [2].

The Bristol property is centrally divided by Bristol Street. Bristol's manufacturing buildings are located on the northern half of the property while the administrative and maintenance buildings and employee parking area are located on the southern half. Pedestrian access to the northern half of the property is restricted by a six foot chain link fence. Access to the two vehicular entrances to the manufacturing portion of the property is restricted by locking gates. Vehicular and pedestrian access to the southern half of the property is unrestricted [2].

Fifteen interconnected Bristol manufacturing buildings are located on the northern half of the property. Buildings are constructed of brick and steel with concrete slab floors. The buildings range from one to six stories in height. The oldest building, constructed around 1897, is located along Bristol Street while the newest, constructed around 1966, is the northernmost. Two small brick structures, formerly housing a pump house and fire house, are located on the western portion of the property near the western entrance to the manufacturing areas [2].

Primary shipping and receiving areas are located on the north side of the northernmost building and along the east side of the complex [2]. Two outdoor, unsheltered former hazardous waste storage areas were observed on the west side of the manufacturing complex during the WESTON/ARCS on-site reconnaissance (OSR). Both areas were covered with bituminous asphalt in good condition without asphalt staining or corrosion. Both areas covered approximately 275 square feet and were enclosed by three inch asphalt berms, which also appeared to be in good condition. WESTON/ARCS observed a stopcocked drain on the south side of the westernmost former storage area. No asphalt staining leading from the drain on the southern former storage area was noted [2]. A third former unbermed storage area is located on a partially sheltered concrete pad at the southwest corner of the courtyard on the east side of the manufacturing complex. WESTON/ARCS did not observe any concrete staining in this area during the OSR [2]. No residual waste was noted in any of the former storage areas.

GENERAL INFORMATION

Site Description and Operational History: Provide a brief description of the site and its operational history. State the site name, owner, operator, type of facility and operations, size of property, active or inactive status, and years of waste generation. Summarize waste treatment, storage, or disposal activities that have or may have occurred at the site; note whether these activities are documented or alleged. Identify all source types and prior spills, floods, or fires. Summarize highlights of the PA and other investigations. Cite references.

— WESTON/ARCS observed four apparently empty steel above ground storage tanks on the manufacturing portion of the property. One of the tanks is located against the west central wall of the manufacturing complex. Three tanks are located against the manufacturing complex walls in the courtyard on the eastern side of the complex. The tanks are located on concrete and/or asphalt and WESTON/ARCS did not observe any staining beneath or around the tanks. WESTON estimates the capacities of each of these tanks to be approximately 500 gallons. Bristol reportedly used these tanks for storage of solvents such as trichloroethene (TCE). The tanks are estimated to be approximately 30 years old, based on visual observations of rusting [2].

— WESTON/ARCS observed an area of oily staining on the manufacturing complex eastern wall in the courtyard. According to the site contact, Mr. Mike Palumba, a 1,000 gallon waste oil underground storage tank (UST) was removed from this area in 1989. WESTON/ARCS noted an area of soil around the former tank, covering approximately 30 square feet, which appeared to have been removed and replaced with sand fill [2].

— WESTON/ARCS noted an area of disturbed soil, covering approximately 1,000 square feet, on the east central side of the complex. According to Mr. Palumba, two steel 10,000 gallon No. 4 heating oil USTs were removed from this area in 1989. Mr. Palumba stated that the tanks were contained in a masonry vault with a concrete floor and roof [2].

— One gasoline pump and associated steel 10,000 gallon UST fill pipe were noted on the south side of the maintenance garage. Mr. Palumba indicated that the pump was used to fuel Bristol maintenance vehicles. According to Mr. Palumba, a steel 8,000 gallon No. 4 fuel oil UST is located on the east side of the administrative building and a steel 2,500 gallon fuel oil UST is located near the southwest corner of the maintenance building. [2]. All fuel oil and gasoline tanks on the property were reportedly installed during the 1950s [8].

— WESTON/ARCS observed two transformer pads on the east side of the manufacturing complex and one pad within an asphalt courtyard on the south side of the complex. In each of the three areas, three unlabelled transformers were observed situated on unbermed concrete pads, enclosed by a eight foot chain linked and barbed wire fence. Vandalization of all the transformers had caused extensive transformer oil leakage onto surrounding concrete and asphalt. An estimated total area of 1,000 square feet of surface staining was noted around these transformers [2].

— One dust collection baghouse was observed by WESTON/ARCS on the west side of the manufacturing complex and another in the eastern courtyard. The site contact indicated that these units were used for dust collection from metal working operations. The doors of both dust

collection units were open, revealing approximately 75 cubic feet of accumulated metal fragments and dust in each unit. WESTON/ARCS did not observe any asphalt staining around the western unit nor any soil staining around the courtyard unit [2].

— WESTON/ARCS observed a large exhaust fan in the west wall of the manufacturing complex. An approximately 500 square foot area of asphalt and sediment beneath and around this fan had an oily black staining. Metal springs were also observed in the stained sediment. A rusty 55 gallon drum, labelled as trichloroethene, was noted by WESTON/ARCS approximately 15 feet south of the stained area. The drum appeared to be empty [2].

GENERAL INFORMATION

Site Description and Operational History: Provide a brief description of the site and its operational history. State the site name, owner, operator, type of facility and operations, size of property, active or inactive status, and years of waste generation. Summarize waste treatment, storage, or disposal activities that have or may have occurred at the site; note whether these activities are documented or alleged. Identify all source types and prior spills, floods, or fires. Summarize highlights of the PA and other investigations. Cite references.

At the south end of the property, south of the employee parking lot, WESTON/ARCS observed an area of disturbed soil, covering approximately 10,000 square feet, which appeared to have been excavated. Mr. Palumba reported that this area had been used for illegal waste trichloroethene (TCE) disposal by an individual or company not associated with Bristol during the mid-1980s and that the area had been remediated under CT DEP guidance between 1987 and 1990 [2]. Mr. Palumba did not know who was responsible for the unauthorized disposal.

Three flush mounted groundwater monitoring wells were observed on the manufacturing portion of the property by WESTON/ARCS: one well is located on the west side of the complex, one in an area of corroded asphalt in the eastern courtyard and one in the eastern driveway, approximately 15 feet east of the transformer pad [2].

WESTON also observed several piles of household and yard waste totalling approximately 50 cubic yards, approximately 50 feet north of the soil remediation area at the south end of the employee parking lot. Mr. Palumba reported that local residents use this area for refuse disposal [2].

A one story concrete and cinderblock building, located at 57 Bristol Street, was noted on the western border of the Bristol property, west of the Bristol administrative building. The building is occupied by Foster Enterprises, Inc., which is involved in the assembly of generator parts. According to Mr. Palumba, Foster leases the building and no manufacturing is conducted on the premises [2].

Manufacturing operations have occurred on the subject property since approximately 1897 when the first manufacturing buildings were constructed [2]. Additional manufacturing buildings were constructed during the 1920s until approximately 1960 [8]. Of the 15 interconnected on-site manufacturing buildings currently present, the northernmost building is reportedly the most recent [2]. The administration building was reportedly constructed during the 1920s and the maintenance garage during the 1940s [8].

Property use prior to 1897 could not be determined. Bristol operated on the property from approximately 1897 until 1961. Between 1961 and 1978, the American Chain and Cable Company operated on-site. Between 1978 and 1981, the facility operated as Babcock Wilcox, Ltd. and between 1981 and the facility closing in September 1988, it operated as the Bristol Babcock Company (Bristol Babcock) [9]. The Bristol Babcock Helicoid Instrument Division was reportedly absorbed into Bristol Babcock in 1986 [10]. All operations reportedly involved the same types of manufacturing processes and chemicals [9].

The Bristol property has been owned by Norman S. Drubner since December 23, 1986. At that time, the property was sold by Bristol Babcock to Mr. Drubner with a Form III filing to the CT DEP [11]. Bristol Babcock ceased its manufacturing operations in September 1988 and moved to Watertown, CT [8,12].

No information concerning the Bristol Company was located during the State file search. Most State file information identified pertained to Bristol Babcock. However, both operations likely involved similar manufacturing processes, the use of similar chemicals and the generation of similar wastes.

GENERAL INFORMATION

Site Description and Operational History: Provide a brief description of the site and its operational history. State the site name, owner, operator, type of facility and operations, size of property, active or inactive status, and years of waste generation. Summarize waste treatment, storage, or disposal activities that have or may have occurred at the site; note whether these activities are documented or alleged. Identify all source types and prior spills, floods, or fires. Summarize highlights of the PA and other investigations. Cite references.

Bristol manufactured pneumatic, electrical and mechanical controlling systems. On-site operations included drilling, milling, stamping and grinding of metal bar stock, vapor degreasing, nickel, cadmium and copper electroplating, epoxy and enamel painting, soldering and welding [3,12]. Steel, brass and aluminum bar stock and a variety of chemicals including acids, metal plating solutions, cutting and lubricating oils, paints and organic compounds such as TCE, 1-1-1-trichloroethane (TCA), chloroform, methyl chloride and toluene were used in the manufacturing process [12]. A metal plating shop was located at the southwest side of the building.

Virgin solvents were stored in the outdoor above ground tanks described in the previous section, in 55 gallon drums inside manufacturing portions of the complex; the two outdoor hazardous waste storage areas on the west side of the manufacturing complex; and possibly the outdoor storage area in the eastern courtyard. Virgin acids were also reportedly stored in the outdoor hazardous waste storage areas as well as inside the manufacturing buildings [8].

Bristol Babcock generated a variety of wastes from manufacturing, including spent solvents, acids, cyanide, oils, paint thinner and paint and metal hydroxide sludge. Bristol Babcock was listed as a RCRA large quantity hazardous waste generator (EPA ID No. CTD001456979). Solvents for degreasing were reportedly reused until they developed a sludge consistency. Bristol Babcock reportedly used a licensed RCRA waste transporter for off-site disposal of the resulting sludge approximately every two to three months. As stated in the PA, in 1987 Bristol Babcock generated approximately 2,000 gallons of nickel sludge and 1,200 gallons of copper and chromium sludge annually [12].

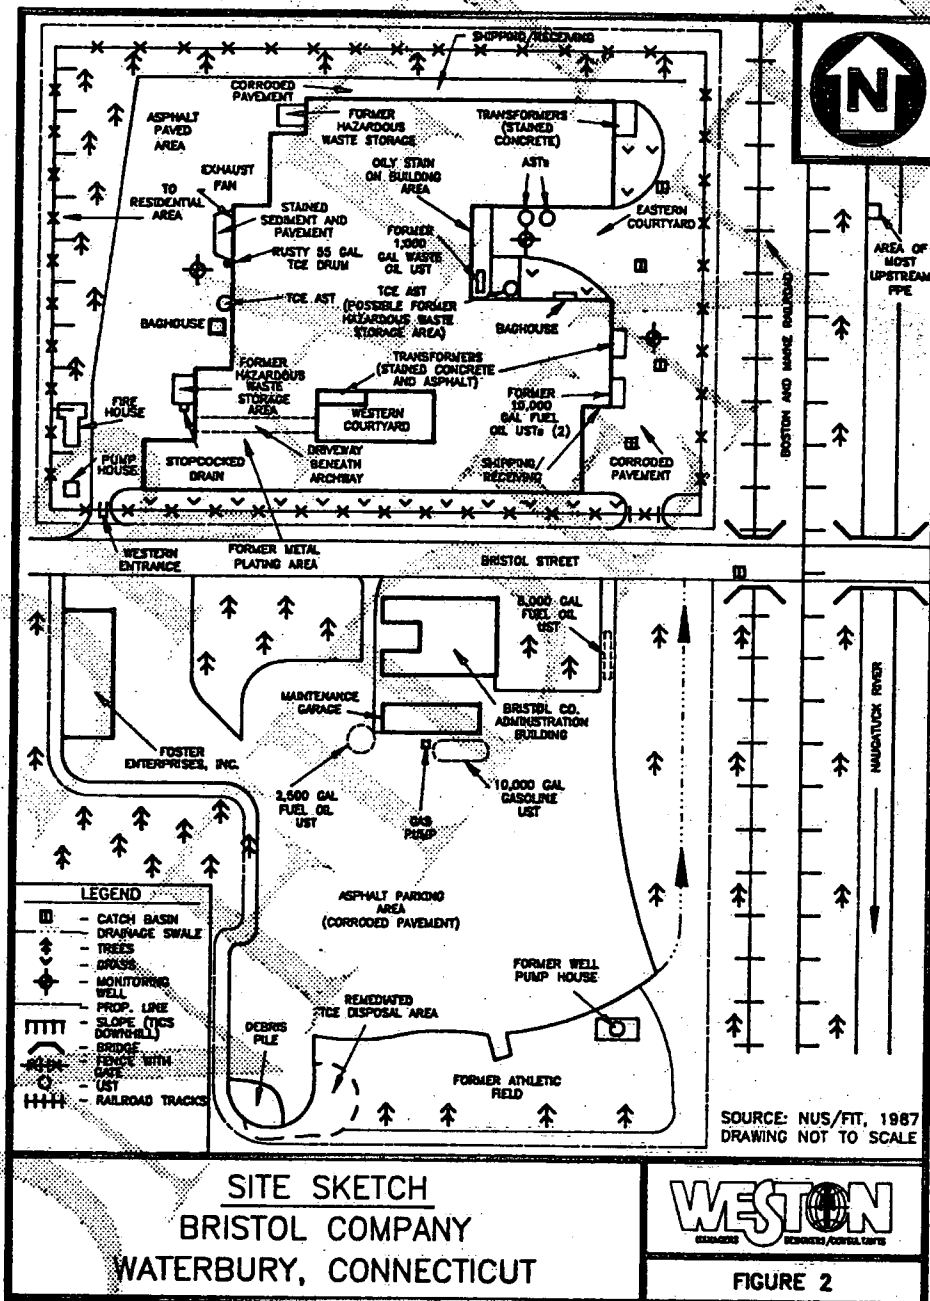

A 1983 Biennial Hazardous Waste Generator Report for Bristol Babcock indicated that 88 gallons of waste TCE (FO01) were hauled to Hampden Color and Chemical in Springfield, MA for disposal and the following wastes were hauled to Recycling Industries in Quincy, MA: 385 gallons of waste paint (D001); 1,540 gallons of wastewater treatment system sludge (F006); 595 gallons of waste cyanide (D003) and 1,760 gallons of waste acid (F006) [3]. In addition, approximately 150 gallons of waste oil were generated per month and stored in the on-site waste oil tank. Waste oil was hauled off-site by the Connecticut Waste Oil Company [13].

Waste solvents, acids and empty 55 gallon drums were stored in the two outdoor bermed storage areas on the west side of the manufacturing building and possibly in the storage area in the eastern courtyard. Empty 55 gallon drums were also stored on a driveway beneath an archway entrance to the western courtyard [8]. Waste management practices prior to the 1980s could not be determined from available file information or the site contact.

Metal hydroxide sludge was also generated from on-site wastewater treatment system used for metal finishing wastewater. Bristol Babcock discharged an average total of 14,440 gallons per day (gpd) of treated wastewater to the Naugatuck River under a National Pollutant Discharge Elimination System (NPDES) Permit Number CT 0000035 [12,14,15]. The wastewater treatment system was installed in 1971 [16]. Between 1971 and 1988, an estimated 200 to 800 gallons of metal hydroxide sludge were generated annually from the wastewater treatment system and hauled off-site for disposal approximately every 75 to 80 days [8].

GENERAL INFORMATION (continued)

Site Sketch: Provide a sketch of the site. Indicate all pertinent features of the site and nearby environments including sources of wastes, areas of visible and buried wastes, buildings, residences, access roads, parking areas, fences, fields, drainage patterns, water bodies, vegetation, wells, sensitive environments, and other features.

GENERAL INFORMATION (continued)

Source Description: include description of containment per pathway, for ground water (see HRS Table 3-2), surface water (see HRS Table 4-2), and air (see HRS Tables 6-3 and 6-9).

Source Evaluation for the Bristol Company

| Potential Source Area | Containment Factors | Spatial Location |
|--|---|---|
| ① Former Outdoor Hazardous Substance and Waste Storage Areas (3) | Asphalt floors and berms (two western areas; concrete slab (eastern area)). | Two on west side of industrial complex; one possibly located in eastern courtyard. |
| ② Former Empty Drum Storage Area | Asphalt pavement | Beneath building archway at western courtyard entrance. |
| ③ Baghouses (2) | None | One on west side of complex; one in eastern courtyard. |
| ④ Outdoor Above Ground Bulk TCE Storage Tanks (4) | Concrete and asphalt beneath tanks | One tank on west side of complex; three tanks in eastern courtyard. |
| ⑤ Former Petroleum Product USTs (5) | None | Two - 10,000 gal. fuel oil USTs on east side of industrial complex; one 8,000 gal. fuel oil UST on east side of admin. building; one 10,000 gal. gasoline UST on south side of garage and one 2,500 fuel oil UST at southwest corner of garage. |

HAZARDOUS WASTE QUANTITY (HWQ) CALCULATION

For each migration pathway, evaluate HWQ associated with sources that are available (i.e., incompletely contained) to migrate to that pathway. (Note: If *Actual Contamination Targets* exist for ground water, surface water, or air migration pathways, assign the calculated HWQ score or 100, whichever is greater, as the HWQ score for that pathway.) For each source, evaluate HWQ for one or more of the four tiers (SI Table 1; HRS Table 2-5) for which data exist: constituent quantity, wastestream quantity, source volume, and source area. Select the tier that gives the highest value as the source HWQ. Select the source volume HWQ rather than source area HWQ if data for both tiers are available.

Column 1 of SI Table 1 indicates the quantity tier. Column 2 lists source types for the four tiers. Columns 3, 4, 5, and 6 provide ranges of waste amount for sites with only one source, corresponding to HWQ scores at the tops of the columns. Column 7 provides formulas to obtain source waste quantity values at sites with multiple sources.

1. Identify each source type.
2. Examine all waste quantity data available for each source. Record constituent quantity and waste stream mass or volume. Record dimensions of each source.
3. Convert source measurements to appropriate units for each tier to be evaluated.
4. For each source, use the formulas in the last column of SI Table 1 to determine the waste quantity value for each tier that can be evaluated. Use the waste quantity value obtained from the highest tier as the quantity value for the source.
5. Sum the values assigned to each source to determine the total site waste quantity.
6. Assign HWQ score from SI Table 2 (HRS Table 2-6).

Note these exceptions to evaluate soil exposure pathway HWQ (see HRS Table 5-2):

- The divisor for the area (square feet) of a landfill is 34,000.
- The divisor for the area (square feet) of a pile is 34.
- Wet surface impoundments and tanks and non-drum containers are the only sources for which volume measurements are evaluated for the soil exposure pathway.

SI TABLE 2: HWQ SCORES FOR SITES

| Site WQ Total | HWQ Score |
|-----------------------|----------------|
| 0 | 0 |
| 1 ^a to 100 | 1 ^b |
| > 100 to 10,000 | 100 |
| > 10,000 to 1 million | 10,000 |
| > 1 million | 1,000,000 |

- ^a If the WQ total is between 0 and 1, round it to 1.
^b If the hazardous constituent quantity data are not complete, assign the score of 10.

GROUND WATER PATHWAY GROUND WATER USE DESCRIPTION

Describe Ground Water Use within 4 Miles of the Site:
Describe generalized stratigraphy, aquifers, municipal and private wells

The Bristol property is underlain by the Waterbury Gneiss Formation, consisting of fine to medium grained schist and gneiss [41]. Depth to bedrock is estimated to be greater than 15 feet based on observations of the absence of bedrock outcrops on and around the site and regional topography [2,41]. There are no known bedrock faults within one mile of the property [41].

Surficial deposits on the eastern third of the property are mapped as alluvium, derived from the Naugatuck River, overlying undifferentiated sands and gravel. The alluvium consists primarily of silt, sand and gravel. These surficial deposits may be as much as 25 feet thick along the Naugatuck River [42]. However, because of the site's distance from the river, a thinner surficial deposit layer is anticipated. Surficial deposits on the western two-thirds of the property are mapped as well to poorly sorted alternating layers of sand and gravel [42]. Given the site's long industrial history, the presence of fill on the property is possible [2].

Soil beneath the Bristol site is mapped as part of the Agawam-Merrimac-Hinckley Series, deep, well drained to excessively well drained soils with a sandy and gravelly substratum, on terraces [43]. Net precipitation in the area is estimated as 20 inches per year, including the effects of lake evaporation [44].

According to the CT DEP, groundwater beneath the site is classified as "GA". Groundwater with this classification is within the area of influence of private and public wells and is presumed suitable for direct human consumption without the need for treatment. The State's goal is to maintain drinking water quality [45,46]. Based on groundwater level measurements taken by WESTON/ARCS from three existing on-site monitoring wells, groundwater depth ranges from approximately three to nine feet below the ground surface [2]. Observations of local topography and drainage suggest that groundwater flow beneath the property is toward the east and the Naugatuck River [2].

(continued)

Show Calculations of Ground Water Drinking Water Populations for each Aquifer:
Provide apportionment calculations for blended supply systems.
County average number of persons per household: _____ Reference _____

Private well user populations were determined through conversations with the Waterbury Water Bureau and the Connecticut Water Company, and by apportioning U.S. Census town population data and the estimated percent of private well users for each town within four miles of the site by radial distance ring. Populations using public well water within each radial distance ring were obtained from the CT DEP "Atlas of Public Water Supply Sources and Drainage Basins in Connecticut" and the Community Water Systems in CT map and the CT Department of Health Services (DHS) public well user database [6,7,47,48,49,50,60].

GROUND WATER PATHWAY GROUND WATER USE DESCRIPTION

Describe Ground Water Use within 4 Miles of the Site:
Describe generalized stratigraphy, aquifers, municipal and private wells

The Bristol property and the surrounding area are provided with public water service from the Connecticut Water Company, Naugatuck Division. Approximately 99 percent of the City of Waterbury receives its water supply from a series of surface reservoirs approximately eight miles north of the site [12,47]. The nearest private well to the site is located approximately one-third of a mile to the southwest [6]. The nearest public well is located approximately 2.2 miles southwest in Naugatuck, CT [7]. An estimated 9,615 and 3,679 persons are served by private and public water supplies within four miles of the property, respectively [6,7,12,45,46,48,49,50]. There are no wellhead protection areas in the Bristol vicinity. Two Marks Brook public wells, operated by the Connecticut Water Company-Naugatuck Division, are reportedly blended with a series of surface water supplies operated by the same company. The wells are located approximately 3.2 miles southeast of the Bristol Site in Naugatuck, and contribute approximately 25 percent (1,750 people) of the total supply. According to the site contact, Bristol used a production well located on the south end of the property for process water. No information regarding the period of usage, production rates or water quality was available [2].

GROUND WATER PATHWAY WORKSHEET

LIKELIHOOD OF RELEASE

| | Score | Data Type | Refs |
|--|-------|-----------|--------------|
| 1. OBSERVED RELEASE: If sampling data or direct observation support a release to the aquifer, assign a score of 550. Record observed release substances on SI Table 4. | 550 | H | 38, 39 40 |
| 2. POTENTIAL TO RELEASE: Depth to aquifer: _____ feet. If sampling data do not support a release to the aquifer, and the site is in karst terrain or the depth to aquifer is 70 feet or less, assign a score of 500; otherwise, assign a score of 340. Optionally, evaluate potential to release according to HRS Section 3. | | | |

LR = 550

TARGETS

| | | | |
|--|-----|---|-------------|
| Are any wells part of a blended system? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> If yes, attach a page to show apportionment calculations. | | | |
| 3. ACTUAL CONTAMINATION TARGETS: If analytical evidence indicates that any target drinking water well for the aquifer has been exposed to a hazardous substance from the site, evaluate the factor score for the number of people served (SI Table 5). Level I: _____ people x 10 = _____ Level II: _____ people x 1 = _____ Total = _____ | 0 | E | 47- 50 |
| 4. POTENTIAL CONTAMINATION TARGETS: Determine the number of people served by drinking water wells for the aquifer or overlying aquifers that are not exposed to a hazardous substance from the site; record the population for each distance category in SI Table 6a or 6b. Sum the population values and multiply by 0.1. | 166 | E | 6, 12 47 |
| 5. NEAREST WELL: Assign a score of 50 for any Level I Actual Contamination Targets for the aquifer or overlying aquifer. Assign a score of 45 if there are Level II targets but no Level I targets. If no Actual Contamination Targets exist, assign the Nearest Well score from SI Table 6a or 6b. If no drinking water wells exist within 4 miles, assign 0. | 10 | E | 6, 12 47 |
| 6. WELLHEAD PROTECTION AREA (WHPA): If any source lies within or above a WHPA for the aquifer, or if a ground water observed release has occurred within a WHPA, assign a score of 20; assign 5 if neither condition applies but a WHPA is within 4 miles; otherwise assign 0. | 0 | E | 12 |
| 7. RESOURCES: Assign a score of 5 if one or more ground water resource applies; assign 0 if none applies. <ul style="list-style-type: none"> • Irrigation (5 acre minimum) of commercial food crops or commercial forage crops • Watering of commercial livestock • Ingredient in commercial food preparation • Supply for commercial aquaculture • Supply for a major or designated water recreation area, excluding drinking water use | 5 | E | 2 |

SOIL EXPOSURE PATHWAY

If there is no observed contamination (e.g., ground water plume with no known surface source), do not evaluate the soil exposure pathway. Discuss evidence for no soil exposure pathway.

Soil Exposure Resident Population Targets Summary

For each property (duplicate page 35 as necessary):

If there is an area of observed contamination on the property and within 200 feet of a residence, school, or day care center, enter on Table 15 each hazardous substance by sample ID. Record the detected concentration. Obtain cancer risk, and reference dose concentrations from SCDM. Sum the cancer risk and reference dose percentages for the substances listed. If cancer risk or reference dose concentrations are not available for a particular substance, enter N/A for the percentage. If the percentage sum calculated for cancer risk or reference dose equals or exceeds 100%, evaluate the residents and students as Level I. If both percentages are less than 100% or all are N/A, evaluate the targets as Level II.

RESIDENT POPULATION NOT EVALUATED

No off-site soil samples were collected during the WESTW/ARCS sampling event. On-site soil samples collected on the west side of the Bristol site, approximately 200 feet east of a residential area and day-care center, indicated contamination with several, volatile and semi-volatile organic compounds, metals, and the PCB Aroclor 1254. However, because these samples were collected from beneath a contiguous layer of asphalt, and the western side of the site is paved, the potential for exposure to soil contaminants is limited. In addition, the entire Bristol site is surrounded by a six-foot chain linked fence, further limiting access [2]

The reference sample (SS-09) was collected from an undisturbed wooded area between the developed western part of the property and the off-site residential area to the west. Analytical results from the reference sample indicate the presence of one volatile organic compound (1,2-dichloroethane [4.3 ug/kg T]), also found on formerly active portions of the site, several semivolatile organic compounds, metals, and two pesticides. All compound concentrations were estimated (T). Compound and element concentrations detected in sample SS09 were generally lower than in the same samples. [38, 39, 40].

APPROVED BY _____

MATH CHECK BY _____ DEPT _____ DATE _____

METHOD REV. BY _____ DEPT _____ DATE _____

DEPT _____ DATE _____

The migration of any subsurface contamination on the western side of the property to the adjacent residential area, appeared unlikely. Observations of site and area topography indicate that groundwater flow direction is toward the east, away from the residential area. The transport of soil contaminants via airborne dust is also unlikely. Most of the subject property is paved or occupied by buildings. A narrow wooded area is located on the western end of the property between the residential areas and the property's manufacturing buildings. No exposed soil was observed in this area. The area was heavily vegetated and the ground was covered with vegetation and leaves [2].
